Technical data sheet

Polystone® P MG

Product characteristics

- Very high chemical resistance
- USP VI and ISO 10993 tested on semi-finished products
- Good sterilisation resistance

- Typical fields of application
- Medical technology

Service temperature, long term Average °C 0 100	
Service temperature, short term (max.) Average °C 150	
Heat deflection temperatureDIN EN ISO 75, method A °C90	
Electrical properties	
Dielectric constant IEC 60250 -	
Dielectric dissipation factor (50Hz) IEC 60250 -	
Volume resistivityIEC 60093 Ω *cm>1013	
Surface resistivityIEC 60093 Ω >1013	
Comparative tracking index IEC 60112 >600	
Dielectric strength IEC 60244 kV/mm 50	

This material is not intended for the use in medical products that remain for more than 24 hours in the human body or are intended to remain in contact with internal human tissue or blood for more than 24 hours. The short-term maximum application temperature only applies to very low mechanical stress for a few hours. The long-term maximum application temperature is based on the thermal ageing of plastics by oxidation, resulting in a decrease of the mechanical properties. This applies to an exposure to temperatures for at least 5.000 hours causing a 50% loss of the tensile strength from the original value (measured at room temperature). This value says nothing about the mechanical strength of the material at high application temperatures. In case of thick-walled parts, only the surface layer is affected by oxidation from high temperature is basically influenced by possible stress factors like impact and/or shock under application. The values stated refer to an minimum degree of impact stress. The electrical properties as stated result from measurements on natural, dry material. With other colours (in particular black) or saturated material, there may be clear differences in the electrical properties and are presented as a guide to choose from our range of materials. This, however, does not include an assurance of specific properties or the soutiability for particular application purposes that are legally binding. Since the properties also depend on the dimension of the semi-finished products and the degree of crystallization (e.g. nucleating by pigments), the actual values of the properties of a particular product may differ from the indicated values.
